Subject: Full Technical & Operational Clarification — Submitted Wallet, Contract & Accepted Working Procedure

Further to your recent communication, and following a thorough review of the details submitted, we wish to address the following points formally and on the record. This clarification is issued to establish the correct technical and operational position of ALSHUMOOKH Global Banking Finance & Credit.

PART I — Technical Analysis of the Submitted Wallet & Contract Address

The address provided as 'Master Wallet' has been verified on the Ethereum blockchain. Our analysis confirms the following critical findings:

- 0x00000000219ab540356cBB839Cbe05303d7705Fa is NOT a privately owned wallet. It is the official Ethereum 2.0 Staking Deposit Contract — deployed by the Ethereum Foundation and publicly verifiable on-chain. No individual, company, or institution owns or controls this address.
- This contract serves as the network-level staking mechanism for Ethereum validators. It is technically impossible for any party to claim ownership or independently access funds held within it.
- Verification Reference: etherscan.io/address/0x00000000219ab540356cBB839Cbe05303d7705Fa

Furthermore, any token contract bearing the name of a publicly traded corporation — such as GlaxoSmithKline — that has not been officially issued and registered by that corporation is not admissible within our system. Our AML & Compliance framework mandates full token provenance verification, chain-of-custody documentation, and official issuance records before any asset can be processed or accepted.

CRITICAL NOTICE: Any submission of a Private Key in any communication constitutes a fundamental security violation. ALSHUMOOKH will never request, receive, or act upon any private key under any circumstances. Such submissions are rejected immediately and flagged under our security protocol.

PART II — ALSHUMOOKH System: Structure & Operational Architecture

ALSHUMOOKH Global operates a Private Financial Infrastructure built on a three-tier architecture. We are not a traditional bank. We are a licensed settlement and distribution platform operating on a private server environment fully integrated with Ethereum blockchain technology.

TIER 1 — M1 Master Ledger:

Central asset repository for approved counterparties. All movements are recorded via full Tokenization engine with immutable timestamps and ledger positions.

TIER 2 — Settlement Engine:

Multi-layer source verification, fee calculation, and settlement queuing. No fund movement occurs without full verification and compliance clearance.

TIER 3 — SIG Profit Distributor:

Dedicated Ethereum smart contract handling automated profit distribution to registered wallets per pre-agreed allocations. Immutable and fully transparent once deployed.

PART III — Our Accepted Working Procedure (Step-by-Step)

For any financial operation to be processed through our system, the following stages must be completed in strict sequential order. No stage may be skipped, reordered, or substituted with informal alternatives:

1 KYC / AML Compliance

Full identity documentation, proof of asset ownership, and source-of-funds declaration.
Non-negotiable. Applies to all counterparties without exception.

2 Formal Wallet Registration

Client wallet addresses registered in our system with full documentation.
Distribution percentages defined, agreed, and locked per the settlement agreement.

3 Settlement Agreement Execution

Formal operational agreement signed by both parties covering: transaction nature, timelines, applicable fees, settlement cycle, and distribution logic. No funds accepted prior to this step.

4 Fund Receipt & On-Chain Confirmation

Sending party transfers agreed assets to the ALSHUMOOKH Master Wallet officially assigned to them.
System auto-generates verified on-chain confirmation and a signed, time-stamped receipt record.

5 Full Settlement & Automated Distribution

After complete verification, the settlement engine executes the full cycle.
Smart contract distributes allocations to all registered wallets automatically and transparently.

PART IV — What We Do Not Accept Under Any Circumstances

The following practices fall entirely outside our operational framework and will not be entertained regardless of the nature, size, or urgency of the proposed transaction:

- Unverified wallets or unaudited smart contracts presented as transaction instruments
- Screenshots, video recordings, or OTP-based confirmations as substitutes for legal documentation
- Tokens lacking verified issuance history, official listing documentation, or traceable on-chain provenance
- Wallet-to-Wallet direct transfers that bypass our formal settlement and verification framework
- Private key sharing by any party — a categorical security violation absent from any legitimate process

We remain fully open to a professional engagement with any party prepared to operate within the framework outlined above. Formal onboarding begins with KYC submission through our official gateway. We welcome structured, compliant, and verifiable business relationships.

Yours faithfully,

ALSHUMOOKH Global Banking Finance & Credit
