

COMPREHENSIVE BLOCKCHAIN TRANSACTION VERIFICATION REPORT

Ethereum Smart Contract Execution and USDT Transfer Assessment

Report Date	29 July 2026
Network	Ethereum Mainnet
Assessment Type	Independent Preliminary On-Chain Technical Review
Addressed To	Mr. Irol Ms. Rima
Issued By	Technical Verification Department – Al Shumookh Global
Reference No.	TVD-ETH-2026-0729-001
Classification	CONFIDENTIAL

Contract Execution: CONFIRMED	USDT Transfer: NOT VERIFIED	Final Settlement: NOT PROVEN
----------------------------------	--------------------------------	---------------------------------

1. Executive Summary

A technical review was conducted in relation to the following Ethereum transaction:

0x6a9e0ea915eea73034e126a59b354a22cf8c93edcfb59404bd98ac1000d212ac

The transaction was successfully confirmed on the Ethereum blockchain and executed a function identified by Etherscan as **Execute** on the following smart contract:

0x0E04736A85433445EF602D07946671685eC94647

However, the available on-chain evidence establishes only that a smart-contract function was called successfully. It does **not** establish that USDT was transferred.

The reviewed transaction does not show:

- An ERC-20 USDT transfer record.
- A Transfer event emitted by the official USDT contract.
- A visible movement of USDT to the nominated beneficiary address.
- A transfer of ETH.
- A verifiable token settlement event.
- Evidence that the bridge contract received or held the stated USDT amount.

Technical Conclusion: The transaction successfully executed a smart-contract function, but no verifiable evidence has been identified showing that an actual USDT transfer occurred within this transaction.

2. Transaction Identification

Transaction Hash	0x6a9e0ea915eea73034e126a59b354a22cf8c93edcfb59404bd98ac1000d212ac
Network	Ethereum Mainnet
Transaction Status	Success
Transaction Sender	0xe7B7652210B47032b8ED53acfbf36F8f7c305A8E
Destination Contract	0x0E04736A85433445EF602D07946671685eC94647
ETH Value Transferred	0 ETH
Gas Used	24,795 Gas

Note: The Success status confirms that the Ethereum Virtual Machine completed the submitted contract call without reverting. It does not, by itself, confirm that a particular asset or token was transferred.

3. Decoded Input Data

Function Called	Execute
Position Owner	0x5a52E96BAcdaBb82fd05763E25335261B270EfcB
Position Address / Beneficiary	0xBD682cfD8382a90adfDd6745780D3D7959c4d939
Raw Amount	1,080,000,000,000,000
Interpreted Amount (USDT, 6 decimals)	1,080,000,000 USDT (input parameter only – not proof of transfer)

Important: The amount is a parameter provided to the Execute function. It is not, by itself, proof that this number of token units was transferred. The input data tells a contract what the caller is requesting — not what was executed.

4. ERC-20 Transfer Event Assessment

Under the ERC-20 standard, a successful token transfer **must** emit a Transfer event. A verifiable USDT transfer would therefore produce a transaction log containing:

- The official USDT contract address: 0xdAC17F958D2ee523a2206206994597C13D831ec7
- A Transfer event signature
- The source wallet address
- The receiving wallet address
- The transferred token value

Finding: No corresponding USDT Transfer event or ERC-20 Token Transfer record was identified in the reviewed transaction. In particular, no log was found showing the official USDT contract (0xdAC17F958D2ee523a2206206994597C13D831ec7) as the token contract, or any Transfer event from the position owner to the beneficiary address.

5. Allowance Assessment

Token Owner	0x5a52E96BAcdaBb82fd05763E25335261B270EfcB
Proposed Spender / Bridge Contract	0x0E04736A85433445EF602D07946671685eC94647
Query Result	Allowance = 0

This means that, at the time the query was performed, the official token contract did not report an active spending allowance from the position owner to the bridge contract. A text-based message signature does **not** automatically create an ERC-20 allowance.

6. Digital Signature Assessment

A signed authorisation message was presented through Etherscan's signature verification service. The signature verification establishes that:

- ✓ The message was cryptographically signed.
- ✓ The signature corresponds to the displayed Ethereum address.
- ✓ The displayed message was associated with that signature.

However, a verified message signature is an off-chain authorisation record. It does NOT automatically:

- ✗ Execute a USDT transfer.
- ✗ Change the token balance.
- ✗ Create an ERC-20 approval or allowance.
- ✗ Deposit tokens into the bridge.
- ✗ Transfer ownership or custody of assets.
- ✗ Produce an ERC-20 Transfer event.

A separate on-chain transaction must use the signature through valid smart-contract logic before it can affect blockchain balances.

7. Bridge Contract Assessment

Contract Address	0x0E04736A85433445EF602D07946671685eC94647
Verification Status	NOT VERIFIED on Etherscan
Source Code	Unavailable
ABI	Unavailable
Decompiler Result	Limited fallback output only – unreliable

Risk Warning: Interacting with an unverified contract carries materially higher risk because the published source cannot be compared with the deployed bytecode. The existence of functions such as claim, release, settle, or finalize cannot be confirmed from a verified source.

8. Findings Summary

Confirmed Findings:

- ✓ The transaction exists on Ethereum Mainnet.
- ✓ The transaction was mined successfully.
- ✓ The transaction called the bridge contract.
- ✓ The function was decoded as Execute.
- ✓ The decoded input contains the stated owner, beneficiary and amount.
- ✓ The verified message signature confirms that a message was signed by the displayed address.
- ✓ The current allowance query returned zero.

Findings NOT Established:

- ✗ No confirmed USDT Transfer event was identified.
- ✗ No ERC-20 Token Transfer record was identified.
- ✗ No evidence of a direct call to the official USDT contract.
- ✗ No evidence that the bridge contract received the claimed USDT.
- ✗ No evidence that the beneficiary wallet received the claimed USDT.
- ✗ No verified contract source or ABI was provided.
- ✗ No independently verified settlement, release, or claim function was identified.
- ✗ The input amount is not proof of token movement.

9. Final Technical Conclusion

Conclusion: No genuine USDT transfer can presently be verified under transaction hash 0x6a9e0ea915eea73034e126a59b354a22cf8c93edcfb59404bd98ac1000d212ac. The transaction's successful status must not be interpreted as confirmation of USDT settlement. A completed USDT transfer must be supported by a Transfer event emitted by the official USDT contract and an ERC-20 token-transfer record showing the source, beneficiary and amount.

Contract Execution:
CONFIRMED

USDT Transfer: NOT
VERIFIED

Final Settlement: NOT
PROVEN

10. Required Evidence From the Sender

For the claimed transfer to be accepted as completed, the sender must provide the following:

1. The transaction hash of the actual USDT transfer.
2. A transaction receipt showing the USDT Transfer event.
3. The official USDT contract address (0xdAC17F958D2ee523a2206206994597C13D831ec7) in the event log.
4. The source and beneficiary addresses in the event topics.
5. The transferred value in the event.
6. An ERC-20 Token Transfer record visible on Etherscan.
7. Evidence that the beneficiary's USDT balance increased.
8. If a bridge was used: the verified source code or official ABI.
9. Documentation explaining the role and mechanism of the Execute function.
10. The second-stage transaction hash if the bridge requires release, claim, settle, or finalize.

11. Formal Notice to the Sender

Subject: Request for On-Chain Proof of USDT Transfer

Dear Mr. Irol / Ms. Rima,

Following a comprehensive technical review of Ethereum transaction 0x6a9e0ea915eea73034e126a59b354a22cf8c93edcfb59404bd98ac1000d212ac, our Technical Verification Department confirms that the transaction successfully called the **Execute** function of the bridge contract 0x0E04736A85433445EF602D07946671685eC94647.

However, our review has not identified an ERC-20 USDT Transfer event, an ERC-20 Token Transfer record, or any other verifiable on-chain evidence showing that the stated USDT amount was transferred to the nominated beneficiary address.

Additionally, the reviewed bridge contract is not source-code verified on Etherscan, and the current allowance query between the stated position owner and the bridge contract returned **zero**.

We therefore formally request that you provide the transaction hash and transaction receipt for the actual USDT transfer, showing a Transfer event emitted by the official Ethereum USDT contract:

0xdAC17F958D2ee523a2206206994597C13D831ec7

The evidence must clearly identify the source address, beneficiary address, and transferred amount. Until such evidence is provided, this transaction remains classified as shown below.

Contract Execution:
CONFIRMED

USDT Transfer: NOT
VERIFIED

Settlement: NOT PROVEN

Sincerely,

Technical Verification Department

Al Shumookh Global Banking Finance & Credit

Date: 29 July 2026
