

■ ADVANCE FEE FRAUD — CONFIRMED

FRAUD ANALYSIS & TECHNICAL ASSESSMENT
REPORT

ISO 20022 pacs.008 Fraudulent Payment Document

Reference: ASIG-FRAUD-RPT-2026-0608-002 | Date: June 8, 2026 | Classification: CONFIDENTIAL

1. EXECUTIVE SUMMARY

The recipient received a document purporting to be a legitimate ISO 20022 pacs.008.001.08 inter-bank credit transfer instruction for EUR 987,000,000. Following detailed technical and forensic analysis, this document has been **classified as a fabricated Advance Fee Fraud (AFF) instrument**, also known as a 419 scam. The document contains multiple critical technical violations of the ISO 20022 standard, uses fictitious financial institution identifiers, incorporates non-standard proprietary fields consistent with known fraud patterns, and originates from an unregistered server infrastructure in West Africa.

No legitimate banking transaction is associated with this document. The on-chain wallet address presented as the settlement destination has no verified USDT balance. The fabricated terminal output appended to the document was generated by the fraudsters' own server and carries no legal or financial validity. All contact with the originating parties should cease immediately.

2. DOCUMENT IDENTIFICATION

Document Type	ISO 20022 pacs.008.001.08 — FI To FI Customer Credit Transfer (claimed)
Message ID	20260326-DEUT-987M-001
Claimed Date	2026-03-26T10:00:00Z
Claimed Amount	EUR 987,000,000.00
Claimed Sender	ACOLMA GMBH — Deutsche Bank AG (DEUTDEFFXXX)
Claimed Receiver	PDP CARITAS FOUNDATION — Cpay Sovereign Node (BIC: CPAYSOV01)
UETR (in document)	4091d214-0ec4-4f04-9579-50563608
Instruction ID	PHTB-ACOLEG-910B-2603245
Transaction ID	20260326-DEUT-987M-886474
Sovereign Server IP	169.239.180.63:5050
Destination Wallet	0x76a4Cc3a60f7E9208d15b27B7bBD0c7f05cA85ac (Ethereum)

3. TECHNICAL VIOLATIONS & FRAUD INDICATORS

FAIL	Invalid UETR Format	UETR '4091d214-0ec4-4f04-9579-50563608' is NOT a valid UUID v4. Standard format requires 8-4-4-4-12 hex characters (36 total). This UETR has only 8 characters in the final segment instead of 12. No real bank can generate an invalid UETR — all SWIFT GPI systems enforce UUID v4 strictly.
FAIL	Fictitious BIC: CPAYSOV01	'Cpay Sovereign Node' with BIC CPAYSOV01 is not registered in the SWIFT BIC directory. All legitimate financial institutions must hold a SWIFT-registered BIC. This BIC was invented by the fraudsters.
FAIL	Identical Instructing & Instructed Agent	Both InstgAgt and InstdAgt reference DEUTDEFFXXX (Deutsche Bank AG). In a real pacs.008, the instructing agent sends the message and the instructed agent receives it — they cannot be the same institution in a genuine inter-bank transfer.
FAIL	Same Deutsche Bank Account Reused	Debtor account '947259564' at Deutsche Bank AG was previously used in other fraudulent documents already reviewed and rejected by the receiving party. This confirms a coordinated fraud campaign using recycled fictional account details.
FAIL	Non-Standard Custom Namespace (gsp:)	The SplmtryData envelope contains a custom namespace 'urn:example:global:settlement:1.0' with tag prefix 'gsp:'. The namespace URI itself contains the word 'example', confirming it is a placeholder invented by non-professionals. No real ISO 20022 implementation uses example-namespaced supplementary data.
FAIL	Release/Access/Blocking Codes	Fields gsp:AccessCode, gsp:ReleaseCode, gsp:FinalCode, and gsp:FinalBlockingCode have no basis in ISO 20022, SWIFT GPI, or any banking standard. These are hallmark elements of Advance Fee Fraud — the fraudsters use them to later demand fees to 'release' funds.
FAIL	Fabricated API Response	The terminal output claiming HTTP 202 and 'Fiat clearance verified. Sovereign L1 Settlement initiated' was generated by the fraudsters' own server at 169.239.180.63:5050. Any server can be programmed to return any message. This response has no legal or financial validity whatsoever.
FAIL	West Africa Server Infrastructure	IP 169.239.180.63 resolves to a server in West Africa — a known origination region for ISO 20022 and SWIFT-format advance fee fraud operations. Legitimate inter-bank settlement infrastructure does not operate via raw IP addresses on non-standard ports.
WARN	Unverified Destination Wallet	Wallet 0x76a4Cc3a60f7E9208d15b27B7bBD0c7f05cA85ac is presented as a 'PDP Treasury Vault'. No verified USDT balance has been confirmed at this address. The USDT contract address referenced (0xdAC17F958D2ee523a2206206994597C13D831ec7) is the real Tether contract — used deliberately to add false credibility to the document.

WAR N	GPI Tracker Status: PENDING_FINAL_CONFIRMATION	The document claims GPI tracker status 'PENDING_FINAL_CONFIRMATION' with milestone 'FUNDS_AVAILABLE_AWAITING_MT910_CAMT053'. This language is designed to create urgency and legitimacy. Real GPI tracker data is only accessible via authenticated SWIFT Alliance connections — it cannot appear in a supplementary XML field.
WAR N	Charity Foundation + Large EUR Amount	'PDP CARITAS FOUNDATION' combined with EUR 987,000,000 follows a classic AFF pattern: large sums directed to foundations or charities are used to justify why funds are 'blocked' and require a third-party intermediary (the victim) to process them.

4. FRAUD METHODOLOGY — HOW THIS SCAM WORKS

STAGE 1 — INITIAL CONTACT: The fraudsters send a professionally formatted ISO 20022 XML document to establish credibility. The use of real standard names (pacs.008, SWIFT, GPI, Deutsche Bank) is deliberate — it is designed to pass a superficial review by non-experts.

STAGE 2 — FABRICATED PROOF: A terminal output showing a '202 Accepted' API response from their own server creates the illusion that funds are 'already in transit' and 'awaiting final confirmation'. This is entirely self-generated and meaningless.

STAGE 3 — THE HOOK (CODES): The document contains AccessCode, ReleaseCode, FinalCode, and FinalBlockingCode. In subsequent communications, the fraudsters will claim these codes must be 'activated' or that a compliance fee, tax, or processing charge must be paid before funds can be released to the recipient.

STAGE 4 — FEE EXTRACTION: Once any payment is made, the fraudsters disappear or invent new obstacles requiring additional payments. No funds ever existed. The entire operation is designed to extract advance fees from the victim under the pretext of releasing a large sum of money.

5. LEGITIMATE vs. FRAUDULENT DOCUMENT COMPARISON

	Legitimate ISO 20022	This Document
UETR	Valid UUID v4 (8-4-4-4-12)	■ Invalid (8-4-4-4-8)
BIC Registry	SWIFT-registered BIC	■ CPAYSOV01 — not registered
Settlement Codes	None — not part of standard	■ AccessCode / ReleaseCode
API Response	Via authenticated SWIFT channel	■ Raw IP server in West Africa
GPI Tracker	Authenticated SWIFT Alliance only	■ Embedded in XML supplementary data

Custom Namespace	Registered ISO namespace only	■ urn:example:... (placeholder URI)
Agent Fields	Different sending/receiving banks	■ Both set to Deutsche Bank

6. FINAL VERDICT & RECOMMENDED ACTIONS

VERDICT: FRAUDULENT — DO NOT PROCESS — DO NOT ENGAGE

Recommended Actions:

- 1. Do not respond to, engage with, or acknowledge this document to its originators.
- 2. Do not submit this document to any system or API endpoint, including the Sovereign Node server at 169.239.180.63.
- 3. Block all communication channels (email, messaging) used by the sending parties.
- 4. Retain this report and all original documents for potential reporting to relevant financial crime authorities (e.g., local financial intelligence unit, INTERPOL, or national cybercrime division).
- 5. Alert your compliance and legal teams to this attempted fraud for awareness and record-keeping.

This report was prepared by the Technical & Settlement Division based on forensic analysis of the submitted document. It does not constitute legal advice. For formal legal proceedings, engage qualified legal counsel.
