

TECHNICAL INTEGRATION QUESTIONNAIRE

Settlement Request Schema — Pre-Integration Assessment

Reference: ASIG-TECH-QA-2026-0608 | Date: June 8, 2026

Dear Sir / Madam,

We write with reference to the Settlement Request JSON Schema document (JSONS-SCHEMA) you have submitted to Alshumookh Group. We acknowledge receipt of your schema package and confirm that it has been reviewed in detail by our Technical and Settlement Division.

Following our technical assessment, we confirm that your JSON schema — structured under the **SETTLEMENT_REQUEST** message type, Protocol v2.0 — is compatible with our ingestion endpoint and can be submitted via:

POST /api/v1/payloads/ingest

The schema fields reviewed — including sender/receiver identifiers, transaction reference, compliance flags (KYC, AML, Sanctions), security parameters (RSA_SHA256, TLS 1.3), and the structured amount block — are all receivable and parseable by our system.

However, before we can proceed to the processing and settlement stage, we require your responses to the following questions. Please complete each section and return this form at your earliest convenience.

SECTION 1 — ASSET IDENTIFICATION — USDX / TOKENIZED_USD

Your schema specifies the asset type as **TOKENIZED_USD** with the symbol **USDX**. Our system currently processes settlement transactions denominated in recognized on-chain assets. In order to validate **USDX** against our supported asset registry and confirm it is eligible for settlement, we require the following details.

Q1. On which blockchain network is USDX issued?

e.g. Ethereum (ERC-20), Tron (TRC-20), BNB Smart Chain (BEP-20), or other

Q2. What is the official smart contract address of the USDX token?

Provide the full checksum address — e.g. 0x...

Q3. Is USDX pegged 1:1 to USD? If yes, which custodian or reserve backs the peg?

e.g. bank reserves, audited stablecoin issuer, algorithmic mechanism, other

Q4. Is USDX listed on any public registry or exchange? If yes, please provide the link.

e.g. CoinGecko, Uniswap, Binance, or similar

SECTION 2 — SETTLEMENT MODE — PRIVATE_INTERNAL_LEDGER

The settlement mode specified in your schema is PRIVATE_INTERNAL_LEDGER. This mode falls outside the scope of our standard on-chain settlement workflow. Operating under this mode requires a separate bilateral technical agreement to define the ledger reconciliation method, settlement finality criteria, and dispute resolution procedures. To assess feasibility, we require the following clarifications.

Q5. What is the exact mechanism of your PRIVATE_INTERNAL_LEDGER settlement?

e.g. off-chain book entry, proprietary ledger, escrow-backed, bilateral netting, other

Q6. How is finality established in your ledger? What constitutes an irrevocable settled state?

e.g. signed acknowledgement, cryptographic proof, timestamp confirmation, other

Q7. Can your system support an alternative on-chain settlement mode as a fallback?

Yes / No — if Yes, provide details (e.g. direct USDT ERC-20 transfer)

SECTION 3 — ON-CHAIN TRANSACTION PROOF & VERIFICATION

For any tokenized asset settlement, our system requires a verifiable on-chain transaction hash (tx_hash) at the time of submission, or a pre-approved escrow/lock mechanism that can be independently verified on-chain. The schema as submitted does not include a transaction hash. Please advise on how settlement finality proof will be provided.

Q8. How do you intend to provide settlement proof if no tx_hash is included at submission?

e.g. tx_hash will be included upon execution, signed attestation, escrow lock hash

Q9. Can you provide a verifiable on-chain escrow or lock transaction prior to settlement initiation?

Yes / No — if Yes, specify the network and contract address

Q10. What is the expected time between schema submission and availability of settlement proof?

e.g. real-time, T+1 hours, T+1 day, specific SLA

SECTION 4 — RECEIVER WALLET & DESTINATION DETAILS

Please provide the destination wallet address to which the tokenized settlement amount is to be directed. This is required for our compliance and wallet whitelisting process. No settlement execution can proceed until the destination wallet has been validated and approved by our compliance team.

Q11. What is the destination wallet address for the settlement funds?

Provide the full address and specify the blockchain network

Q12. Is the destination wallet custodial (exchange/institution) or self-custodied?

Custodial / Self-custodied — if custodial, please name the institution

Q13. Has the destination wallet passed your internal KYC/AML screening?

Yes / No — please confirm

SECTION 5 — SECURITY, API CONNECTIVITY & CONTACT

Your schema references mTLS (mutual TLS) for secure channel authentication. Our current API infrastructure operates under TLS 1.3 with API-key-based authentication. If mTLS is a hard requirement on your side, please note that establishing a dedicated secure channel requires a separate discussion with our infrastructure team.

Q14. Is mTLS a strict requirement, or can you operate under TLS 1.3 with API-key authentication?

mTLS required / TLS 1.3 + API key acceptable / either option works

Q15. Please provide your designated technical contact for integration coordination.

Full name / Email address / Phone number

We look forward to receiving your completed responses. Once reviewed, our Technical and Settlement Division will be in a position to provide a formal integration proposal and proceed accordingly. All information provided will be treated as strictly confidential.

Yours sincerely,

ALSHUMOOKH GROUP
Technical & Settlement Division
